ROLL NUMBER: 546

COURSE: MSc CS

**SUBJECT: ANALYSIS OF
ALGORITHM AND RESEARCH
COMPUTING**

PRACTICAL: 1-8

INDEX				
NO	DATE	TITLE	PAGE NO.	SIGN
1		Randomized Selection Algorithm	3	
2		Heap Sort Algorithm	5	
3		Radix Sort Algorithm	8	
4		Bucket Sort Algorithm	11	
5		Floyd - Warshall Algorithm	14	
6		Counting Sort Algorithm	19	
7		Set Covering Problem	22	
8		Subset Sum Problem	24	

PRACTICAL 1

Q.1) Write a Program for Randomized Selection Algorithm

```
from random import randrange

def partition(x, pivot_index = 0):
    i = 0
    if pivot_index != 0: x[0],x[pivot_index] = x[pivot_index],x[0]
    for j in range(len(x)-1):
        if x[j+1] < x[0]:
            x[j+1],x[i+1] = x[i+1],x[j+1]
            i += 1
    x[0],x[i] = x[i],x[0]
    return x,i

def RSelect(x,k):
    if len(x) == 1:
        return x[0]
    else:
        xpart = partition(x,randrange(len(x)))
        x = xpart[0] # partitioned array
        j = xpart[1] # pivot index
        if j == k:
            return x[j]
        elif j > k:
            return RSelect(x[:j],k)
    else:
```

```
k = k - j - 1

return RSelect(x[(j+1):], k)

x = [3,1,8,4,7,9]

for i in range(len(x)):

    print (RSelect(x,i)),
```

Q.2) Write a Program for Heap Sort Algorithm

Python program for implementation of heap Sort

To heapify subtree rooted at index i.

n is size of heap

```
def heapify(arr, N, i):
```

```
    largest = i # Initialize largest as root
```

```
    l = 2 * i + 1 # left = 2*i + 1
```

```
    r = 2 * i + 2 # right = 2*i + 2
```

```
    # See if left child of root exists and is
```

```
    # greater than root
```

```
    if l < N and arr[largest] < arr[l]:
```

```
        largest = l
```

```
    # See if right child of root exists and is
```

```
    # greater than root
```

```
    if r < N and arr[largest] < arr[r]:
```

```
        largest = r
```

```
    # Change root, if needed
```

```
if largest != i:
    arr[i], arr[largest] = arr[largest], arr[i] # swap

    # Heapify the root.
    heapify(arr, N, largest)
```

```
# The main function to sort an array of given size
```

```
def heapSort(arr):
    N = len(arr)

    # Build a maxheap.
    for i in range(N//2 - 1, -1, -1):
        heapify(arr, N, i)

    # One by one extract elements
    for i in range(N-1, 0, -1):
        arr[i], arr[0] = arr[0], arr[i] # swap
        heapify(arr, i, 0)
```

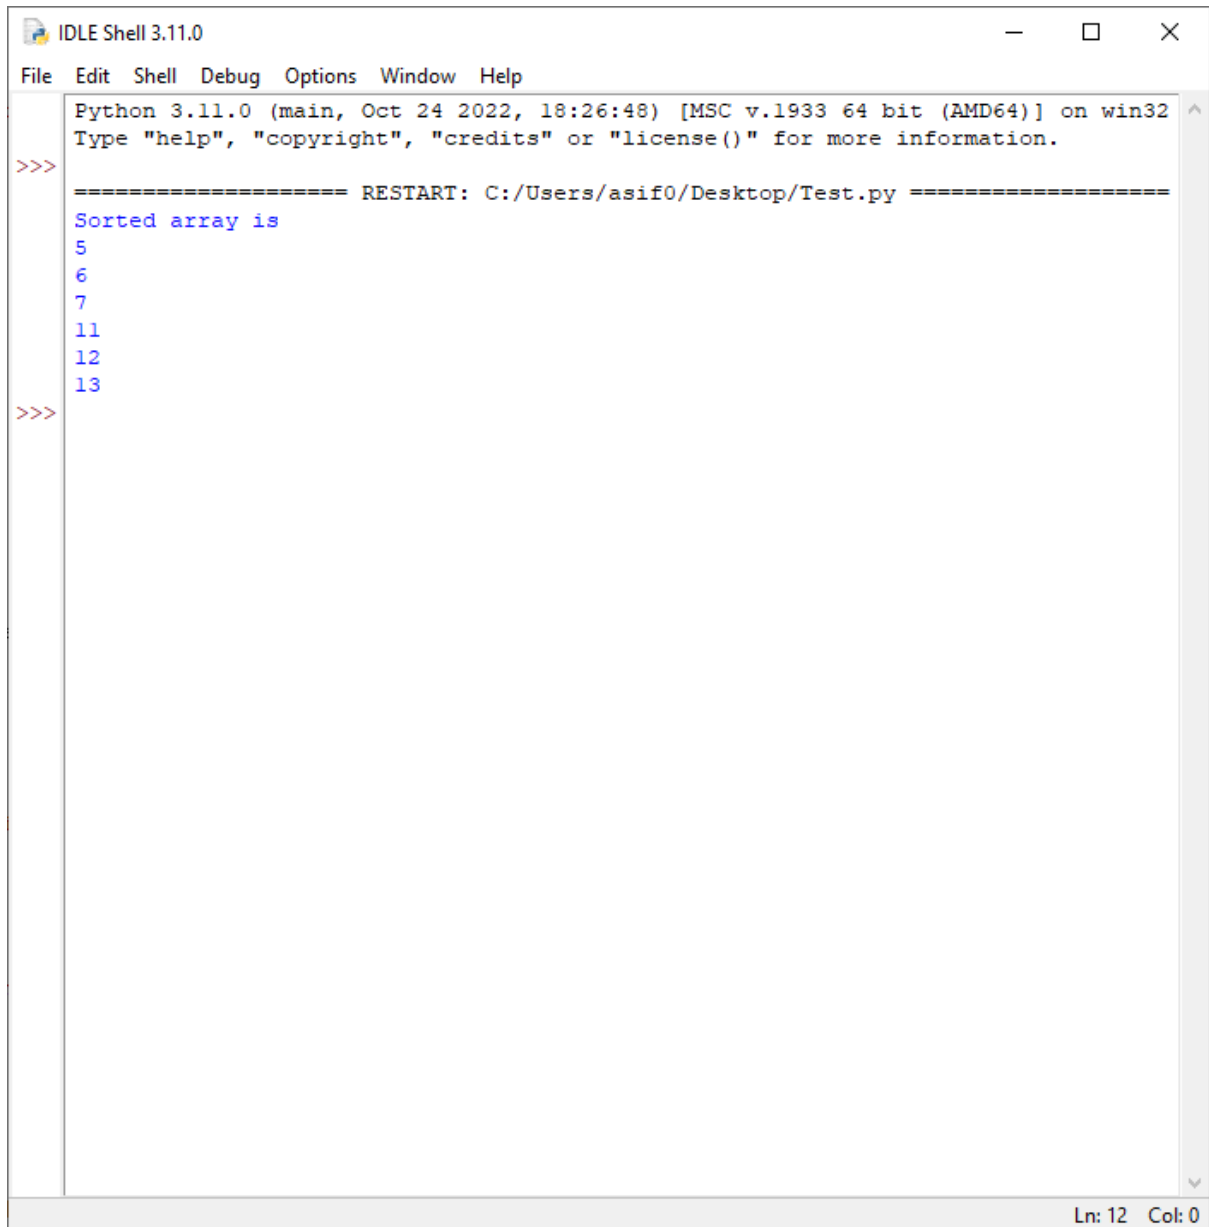

```
# Driver's code
if __name__ == '__main__':
    arr = [12, 11, 13, 5, 6, 7]
```

```
# Function call
heapSort(arr)
N = len(arr)
```

```
print("Sorted array is")
```

```
for i in range(N):  
    print("%d" % arr[i], end=" ")

3) Write a Program to perform Radix Sort Algorithm

Python program for implementation of Radix Sort

A function to do counting sort of arr[] according to

the digit represented by exp.

```
def countingSort(arr, exp1):
```

```
    n = len(arr)
```

```
    # The output array elements that will have sorted arr
```

```
    output = [0] * (n)
```

```
    # initialize count array as 0
```

```
    count = [0] * (10)
```

```
    # Store count of occurrences in count[]
```

```
    for i in range(0, n):
```

```
        index = arr[i] // exp1
```

```
        count[index % 10] += 1
```

```
    # Change count[i] so that count[i] now contains actual
```

```
    # position of this digit in output array
```

```
    for i in range(1, 10):
```

```
count[i] += count[i - 1]
```

```
# Build the output array
```

```
i = n - 1
```

```
while i >= 0:
```

```
    index = arr[i] // exp1
```

```
    output[count[index % 10] - 1] = arr[i]
```

```
    count[index % 10] -= 1
```

```
    i -= 1
```

```
# Copying the output array to arr[],
```

```
# so that arr now contains sorted numbers
```

```
i = 0
```

```
for i in range(0, len(arr)):
```

```
    arr[i] = output[i]
```

```
# Method to do Radix Sort
```

```
def radixSort(arr):
```

```
    # Find the maximum number to know number of digits
```

```
    max1 = max(arr)
```

```
    # Do counting sort for every digit. Note that instead
```

```
    # of passing digit number, exp is passed. exp is  $10^i$ 
```

```
    # where i is current digit number
```

```
    exp = 1
```

```
    while max1 / exp >= 1:
```

```
        countingSort(arr, exp)
```

```
        exp *= 10
```

Driver code

```
arr = [170, 45, 75, 90, 802, 24, 2, 66]
```

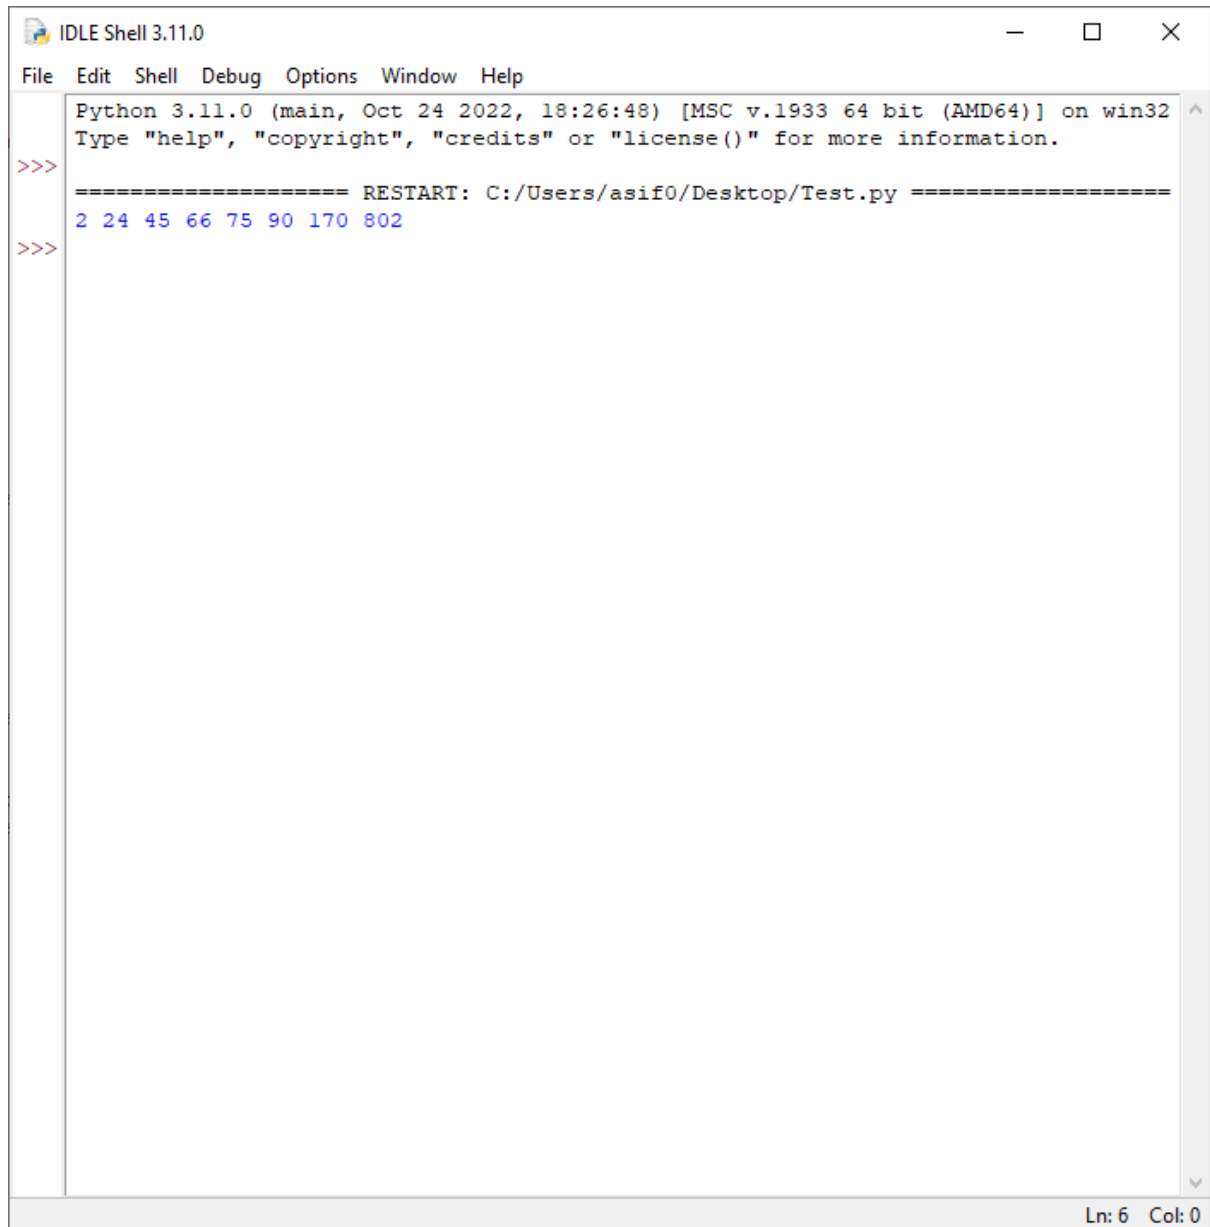

Function Call

```
radixSort(arr)
```

```
for i in range(len(arr)):
```

```
    print(arr[i],end=" ")
```

4) Write a Program to Perform Bucket Sort Algorithm

Python3 program to sort an array

using bucket sort

def insertionSort(b):

for i in range(1, len(b)):

up = b[i]

j = i - 1

while j >= 0 and b[j] > up:

b[j + 1] = b[j]

j -= 1

b[j + 1] = up

return b

def bucketSort(x):

arr = []

slot_num = 10 # 10 means 10 slots, each

slot's size is 0.1

for i in range(slot_num):

arr.append([])

Put array elements in different buckets

```
for j in x:

    index_b = int(slot_num * j)

    arr[index_b].append(j)
```

```
# Sort individual buckets
```

```
for i in range(slot_num):

    arr[i] = insertionSort(arr[i])
```

```
# concatenate the result
```

```
k = 0
```

```
for i in range(slot_num):

    for j in range(len(arr[i])):

        x[k] = arr[i][j]

        k += 1
```

```
return x
```

```
# Driver Code
```

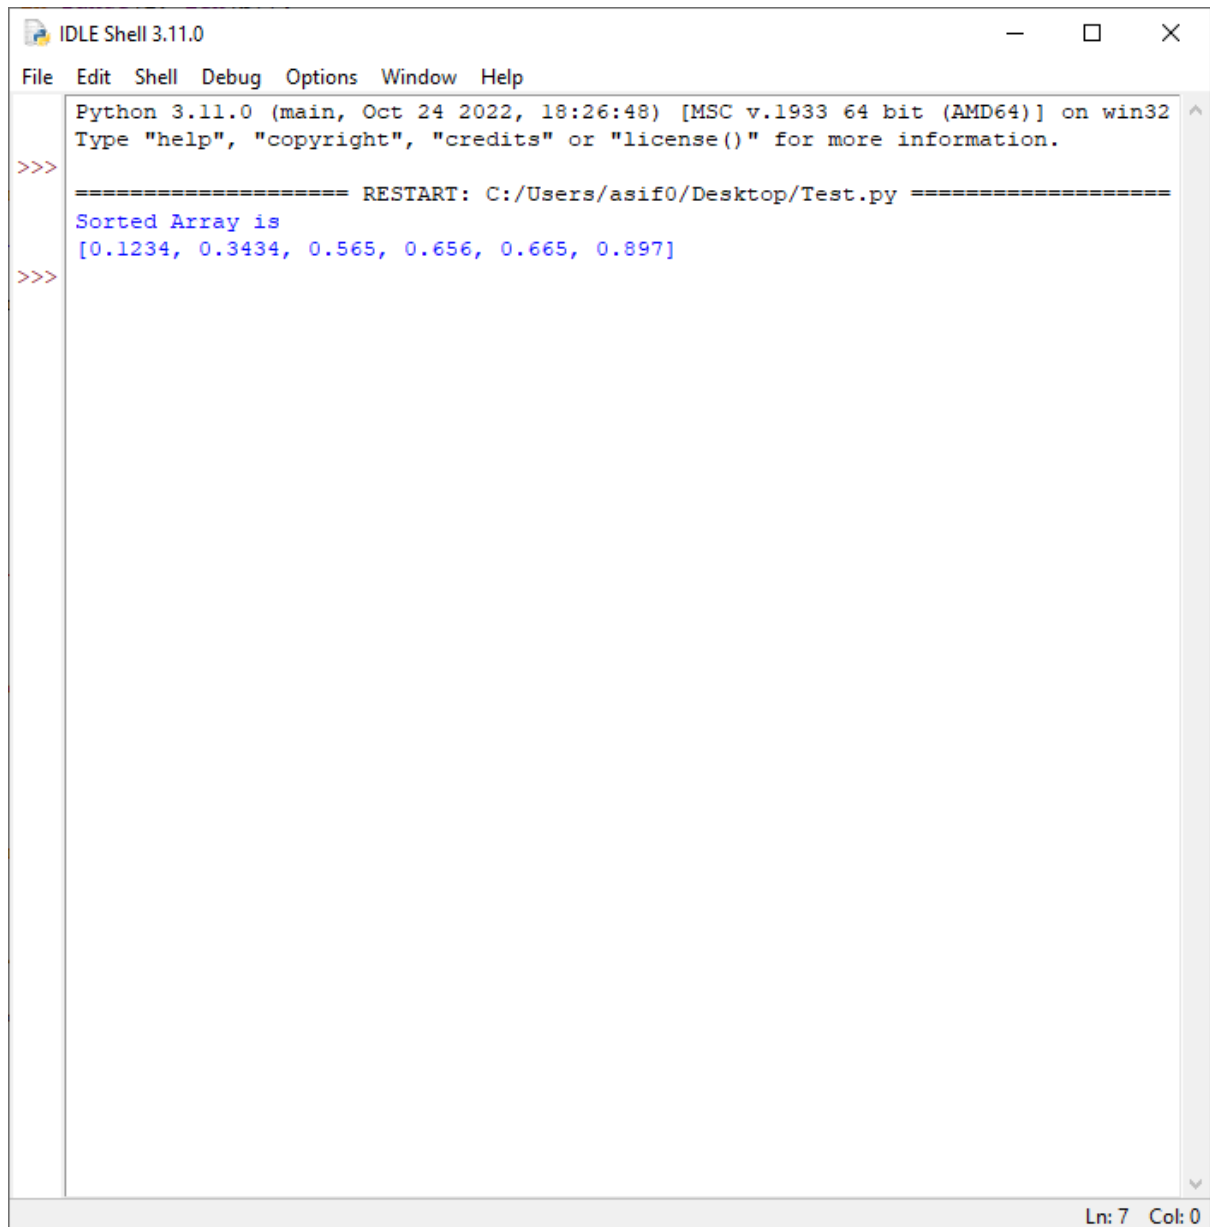

```
x = [0.897, 0.565, 0.656,

     0.1234, 0.665, 0.3434]
```

```
print("Sorted Array is")
```

```
print(bucketSort(x))
```

OUTPUT:

PRACTICAL 5

5) Write a Program to Perform Folyd-Warshall algorithm

Python3 Program for Floyd Warshall Algorithm

Number of vertices in the graph

V = 4

Define infinity as the large

enough value. This value will be

used for vertices not connected to each other

INF = 99999

Solves all pair shortest path

via Floyd Warshall Algorithm

def floydWarshall(graph):

""" dist[][] will be the output

matrix that will finally

have the shortest distances

between every pair of vertices """

""" initializing the solution matrix

same as input graph matrix

OR we can say that the initial

values of shortest distances

are based on shortest paths considering no

intermediate vertices """

```
dist = list(map(lambda i: list(map(lambda j: j, i)), graph))
```

""" Add all vertices one by one

to the set of intermediate

vertices.

---> Before start of an iteration,

we have shortest distances

between all pairs of vertices

such that the shortest

distances consider only the

vertices in the set

{0, 1, 2, .. k-1} as intermediate vertices.

----> After the end of a

iteration, vertex no. k is

added to the set of intermediate

vertices and the

set becomes {0, 1, 2, .. k}

"""

for k in range(V):

pick all vertices as source one by one

for i in range(V):

Pick all vertices as destination for the

above picked source

```

for j in range(V):

    # If vertex k is on the shortest path from
    # i to j, then update the value of dist[i][j]
    dist[i][j] = min(dist[i][j],
                      dist[i][k] + dist[k][j]
                      )

6) Write a Program for Counting Sort Algorithm in python

Python3 program for counting sort

The main function that sort the given string arr[] in

alphabetical order

def countSort(arr):

The output character array that will have sorted arr

output = [0 for i in range(len(arr))]

Create a count array to store count of individual

characters and initialize count array as 0

count = [0 for i in range(256)]

For storing the resulting answer since the

string is immutable

ans = ["" for _ in arr]

Store count of each character

for i in arr:

count[ord(i)] += 1

Change count[i] so that count[i] now contains actual

```
# position of this character in output array
```

```
for i in range(256):
```

```
    count[i] += count[i-1]
```

```
# Build the output character array
```

```
for i in range(len(arr)):
```

```
    output[count[ord(arr[i])]-1] = arr[i]
```

```
    count[ord(arr[i])] -= 1
```

```
# Copy the output array to arr, so that arr now
```

```
# contains sorted characters
```

```
for i in range(len(arr)):
```

```
    ans[i] = output[i]
```

```
return ans
```

```
# Driver code
```

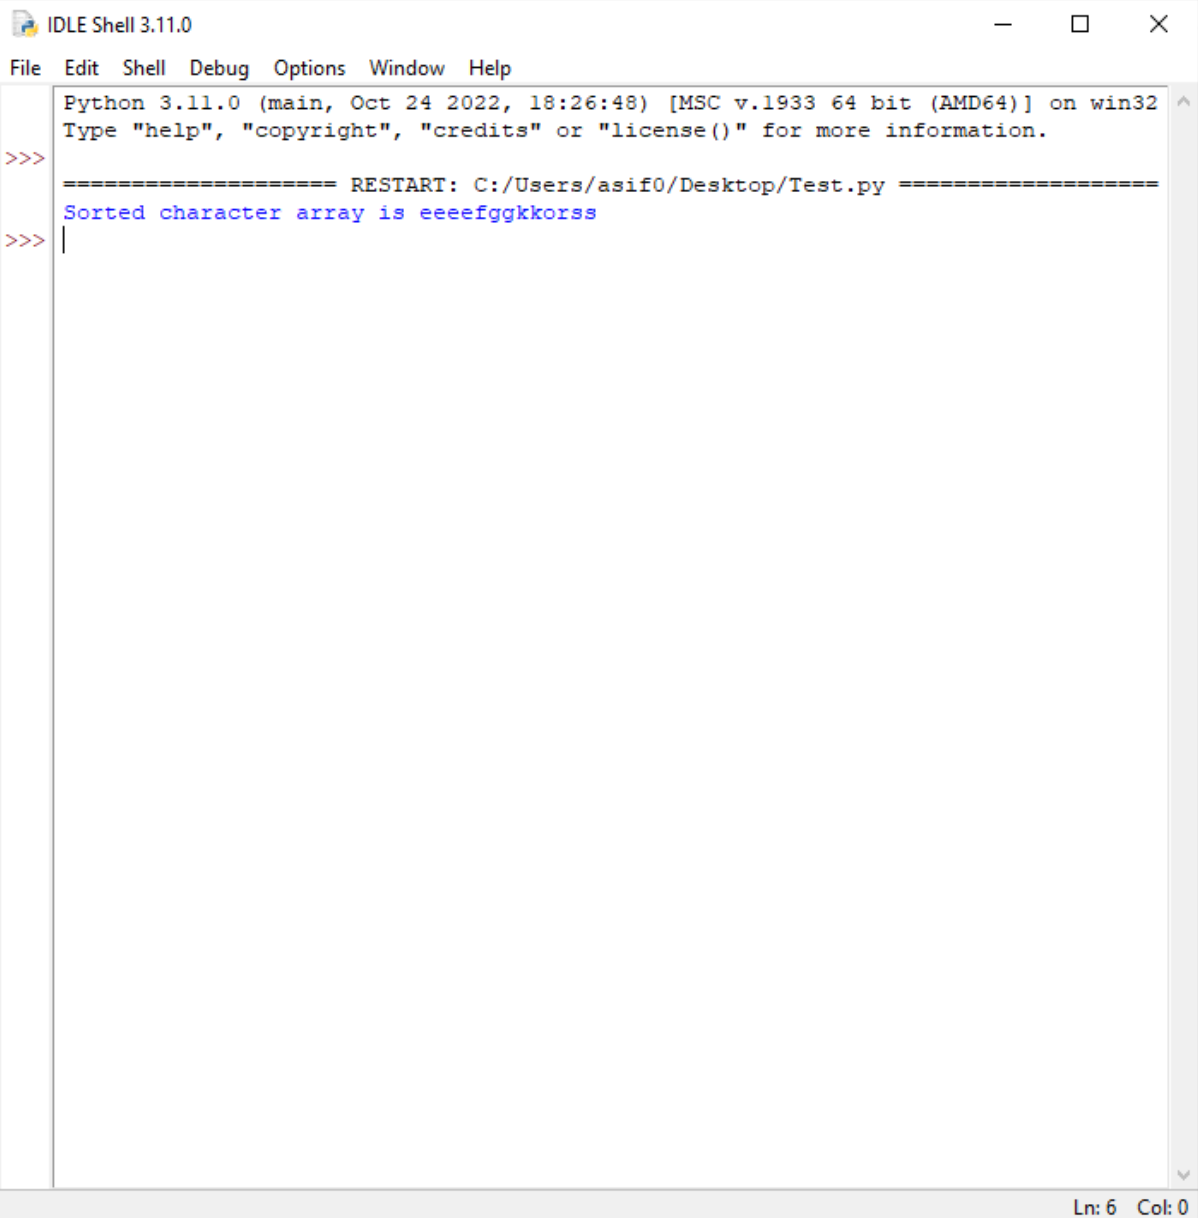

```
if __name__ == '__main__':
```

```
    arr = "geeksforgeeks"
```

```
    ans = countSort(arr)
```

```
    print("Sorted character array is % s" % "".join(ans))
```

OUTPUT:

The image shows a screenshot of the Python IDLE Shell 3.11.0 window. The window has a title bar with the text "IDLE Shell 3.11.0" and standard window controls (minimize, maximize, close). Below the title bar is a menu bar with the following options: File, Edit, Shell, Debug, Options, Window, and Help. The main area of the window is a text editor displaying the following text:

```
Python 3.11.0 (main, Oct 24 2022, 18:26:48) [MSC v.1933 64 bit (AMD64)] on win32
Type "help", "copyright", "credits" or "license()" for more information.

>>>
===== RESTART: C:/Users/asif0/Desktop/Test.py =====

>>> |
```

The text is displayed in a monospaced font. The prompt characters ">>>" are in red. The output text "Sorted character array is eeeefggkkorss" is in blue. The cursor is positioned at the end of the last line, indicated by a vertical bar "|".

At the bottom right of the window, the status bar displays "Ln: 6 Col: 0".

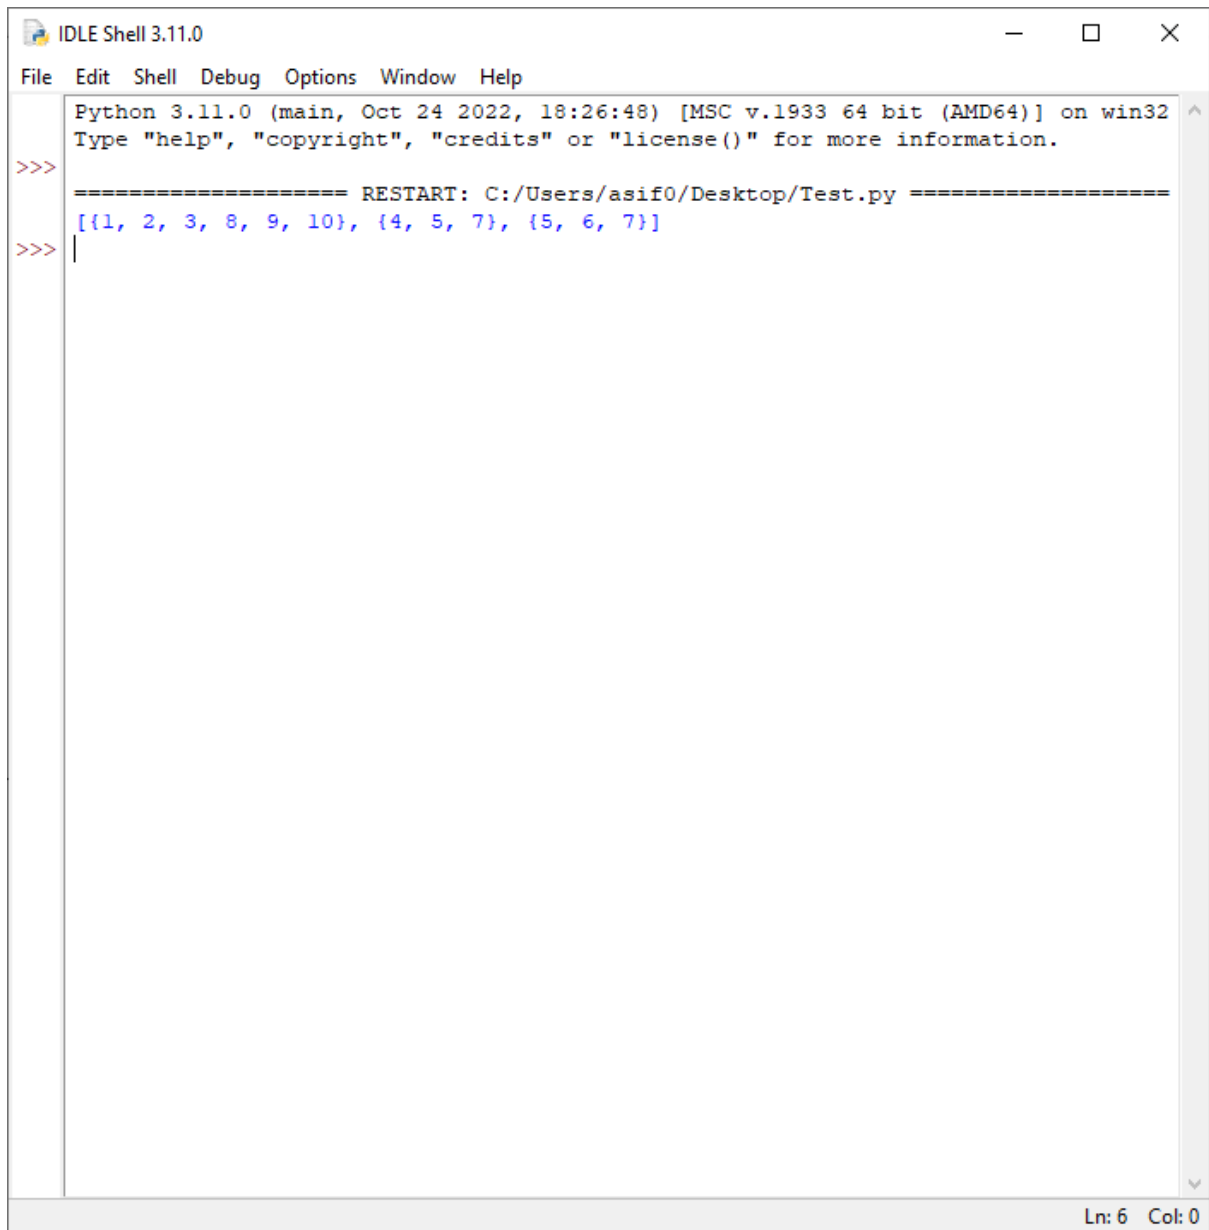

PRACTICAL 7

7) Write a program for Set Covering Problem

```
def set_cover(universe, subsets):  
    """Find a family of subsets that covers the universal set"""  
    elements = set(e for s in subsets for e in s)  
    # Check the subsets cover the universe  
    if elements != universe:  
        return None  
    covered = set()  
    cover = []  
    # Greedily add the subsets with the most uncovered points  
    while covered != elements:  
        subset = max(subsets, key=lambda s: len(s - covered))  
        cover.append(subset)  
        covered |= subset  
  
    return cover  
  
def main():  
    universe = set(range(1, 11))  
    subsets = [set([1, 2, 3, 8, 9, 10]),  
               set([1, 2, 3, 4, 5]),  
               set([4, 5, 7]),  
               set([5, 6, 7]),  
               set([6, 7, 8, 9, 10])]  
    cover = set_cover(universe, subsets)  
    print(cover)  
  
if __name__ == '__main__':
```

main()

OUTPUT:

A screenshot of the IDLE Shell 3.11.0 window. The window has a title bar with the text "IDLE Shell 3.11.0" and standard window controls (minimize, maximize, close).
